

### DiKon supplement – version 3.0

#### to DiKon, BIM7AA and Molio's construction element specifications

#### Instruction

#### Introduction

In order to establish a simple method for defining the contents of mandatory properties of construction elements in a building model at a given time and for a specific ICT service, DiKon has developed a supplement to DiKon and BIM7AA's construction element specifications (in Danish: bygningsdelsspecifikation).

The construction element specifications only describe requirements for property data (LOI level).

The purpose of the supplement is to establish a connection to several of the ICT services described in sections 9.1-9.10, as well as the service regarding sustainability outlined in the Description of Services for Building and Landscape 2018 (EN) (YBL 2018). This supplement adds a few additional property data for the service in section 9.4 Digital design and property data for several of the other ICT services, as well as for 9.33 Sustainability, individual services.

This supplement exclusively handles the information that appears in a building model and does not include other project-related information.

#### Contents

DiKon's supplement consists of property data related to the four LOI levels 200, 300, 325 and 400 and must be seen in conjunction with the overall LOD DK levels described in DiKon, BIM7AA and Molio's construction element specifications.

For each LOI level, mandatory property data related to the ICT services are specified:

- 9.1 Classification
- 9.4 Digital design
- 9.6 Bill of quantities
- 9.33 Sustainability, individual services

In addition, a number of supplementary property data have been listed, which can be selected on a project-specific basis and as needed, if clearly indicated.

The measurement rules in the publication refer to the applicable Molio measurement rules. Moreover, a mapping to the corresponding CCS properties has been carried out for all relevant property data, serving as a reference.

#### Use

When entering into agreements between parties in the buildings industry, it is recommended to use this supplement. It allows for clear agreements on the properties that should be included in the delivery of building models, particularly when opting for ICT services from YBL 2018.

When entering into an agreement, it is important to specify that DiKon's supplement is included in the requirements, as there are other possible methods for specifying requirements regarding property data.

Property data specified under LOI levels is mandatory if the specified ICT service in YBL 2018 is selected in conjunction with this supplement.

#### Comments

DiKon, BIM7AA and Molio are collaborating to further harmonise the requirements for property data related to ICT services.

This supplement is updated on a regular basis, and we welcome any comments or suggestions. They can be mailed to **DIKON** mail@dikon.info.

### DiKon supplement – version 3.0 to DiKon, BIM7AA and Molio's construction element specifications
